

Office Puzzle RBT Assistant

User guide • Version 1.1.107 • October 2026

Use this guide to install the Chrome extension, choose a client and date, build a task queue, enter one program or run a batch, and check the result in Office Puzzle.

Start with accurate session data

The assistant can generate daily allocations and trial or interval patterns from weekly targets. These are plans, not observed session results. A target percentage does not establish which trials succeeded or which intervals contained a behavior. Only write values and patterns that match your actual records. If the generated result does not match, enter the observed data directly in Office Puzzle.

Install the extension

1. Extract the v1.1.107 ZIP into a permanent folder on your computer.
2. In Chrome, enter `chrome://extensions` in the address bar and turn on Developer mode.
3. Choose Load unpacked. Select the extracted folder that contains `manifest.json` directly inside it, not the ZIP or a parent folder.
4. Confirm the extension is named Office Puzzle RBT Assistant and shows version 1.1.107. Pin it from Chrome's Extensions menu if useful.
5. Sign in to Office Puzzle, open the client's behavior or replacement data page, and click the extension icon to open its side panel.

Update an existing installation

Stop any active run first. If you replace the files in the same installation folder, click Reload on the extension card at `chrome://extensions`. If you use a new folder, disable the old copy before loading the new one. Refresh the Office Puzzle tab afterward and verify the version. Recheck your client, date, hours, and tasks before writing.

Your daily workflow

Open client → choose date and program → enter the weekly target → Add + Next → check the plan and Tasks → Run → check Office Puzzle.

For a single program, use Run once beside Add + Next. It can begin writing immediately when the selected date is empty.

Before finishing

Verify the client, dates, actual counts or outcomes, unused intervals, and completed tasks in Office Puzzle. Finish the site's normal save and documentation steps. This is an independent assistant; use it within your employer's approved workflow.

Know the controls

The panel adapts to the Office Puzzle page. Use the current labels below; a separate Review or Confirm review step is not part of the main workflow in this version.

Control	What it does
Program selector	Choose a behavior or replacement/skill program. Open the list and type in its search field to filter names.
Weekly target	Frequency: a total count. Replacement and partial interval: a percentage. Check the field label before entering a value.
Add + Next	Creates the plan, queues the selected date if it is unrecorded, and advances to the next program. It does not write to Office Puzzle.
Run once	Plans and writes only the selected program/date without adding a task. Existing entries require a replacement decision.
Run	The bottom button starts the Tasks queue for the current page and selected date. It changes to Working... while active.
Stop	Stops an individual write or batch. A click already sent may finish. It does not undo completed changes.
Retry	Resumes a stopped task when available. Previously completed tasks are skipped.
Previous and next arrows	Move between programs without adding a task. They stop at the ends of the list.
Theme button	Switches between light and dark appearance.

Choose the correct date

Use the dates shown in the plan strip and its date navigation arrows where available. Dates come from the writable columns discovered in Office Puzzle. The planning period is not a fixed Monday-to-Friday week; Sunday may appear when it is available.

Selecting a date targets that existing table column. It does not enter data for every date shown. Future dates may be available for planning, but observed-data writes are blocked until today or a past date. Finish or stop the current run before changing dates.

Let the page finish loading

The assistant connects and discovers programs automatically. It may scroll through the page to load tables and restore your position. Switching clients or switching between behavior and replacement pages triggers discovery for that context. If you see Select a client, open a client in Office Puzzle.

Plan and run your tasks

Build a queue

1. Check the client name, Office Puzzle page, and selected date. For partial interval programs, also check Hours.
2. Choose a program and enter its weekly target. Use Add + Next, or press Enter while the target field is selected.
3. The assistant calculates the remaining plan using recorded values it can read. It adds an unrecorded selected date to Tasks and moves forward. At the last program, it stays there.
4. Repeat for the programs you need. Return to programs through the selector to inspect their date-strip values. Check the Tasks list before running.
5. Remove any task whose planned entry does not match the actual session. Use Office Puzzle directly when you need to enter a different observed count or exact trial/interval pattern.

Add + Next preserves existing entries and moves on without adding a duplicate task or asking to overwrite. If no task appears, check whether that program/date already contains data.

Run the queue

Click Run in the bottom bar. The assistant processes tasks in sequence and checks each result before advancing. Run the behavior and replacement queues from their respective Office Puzzle pages; do not expect a single Run to navigate across every client or page.

Task indicator	Meaning
Dot	Queued and waiting to run.
Spinner	Writing or attempting recovery on this task.
Checkmark	The writer verified the planned result in the table.
Check Office Puzzle	The task needs attention. Hover the row or message for more detail.

A completion check verifies the entered result against the plan. It does not confirm that the plan reflects the session, and it is not a substitute for your final review of Office Puzzle.

Keep the target page available

A batch targets the Office Puzzle tab where it started. Keep that tab and the side panel open. Avoid manual cell edits, date changes, or navigation to another client/page during the run. If progress remains on one task, use Stop before investigating.

Use Run once for one program

Run once is the alternative to building a queue. It may be hidden while unfinished tasks exist and return after those tasks are completed or removed. Confirm any replacement prompt carefully: replacing can clear the old entry before writing the new one.

Understand the data types

Frequency behaviors

Weekly target is a count of occurrences across the displayed planning period. The assistant reads existing daily counts and allocates the remaining amount across unrecorded dates, subject to table capacity. Previously recorded values are retained.

Example: a weekly target of 25 with 9 already recorded leaves 16 to plan. That calculation does not determine today's observed count. Check the selected date's planned value against your session record before running it.

Replacement and skill programs

Weekly target % is used to plan successes across 10 trials per day. Each daily success contributes 10 percentage points: 6 successful trials out of 10 is 60%. Whole-trial limits can make the achievable weekly percentage differ from the requested target.

For these tables, + means a successful opportunity and – means an unsuccessful opportunity. The generated trial order may be randomized. Matching the daily percentage alone is not enough if the individual outcomes differ from the session record. All 10 trial outcomes need to represent the actual session.

Partial interval behaviors

The Hours control appears beside the client name for partial interval programs. It is not needed for frequency or replacement pages. Enter the actual session duration in 0.5-hour increments using the field or its plus/minus buttons; press Enter or leave the field to commit.

Hours worked	Active 30 minute intervals	Rows that stay blank
2.5	1–5	6 onward
3.0	1–6	7 onward
3.5	1–7	8 onward
4.0	1–8	9 onward

Hours are saved by client and date and shared across that day's partial interval programs. This version allows 0.5–12 hours only where the table has enough interval rows. Do not assume a fixed eight-interval limit or trust a remembered/default duration without checking it.

For partial interval data, + means the behavior occurred in that interval and – means it did not. Unused intervals must remain blank. For 3.5 hours, interval 8 and all later rows must be blank; for 4 hours, intervals 9 onward must be blank.

The writer checks both the active interval pattern and Daily Average before reporting success. After the run, inspect the unused rows too.

Stop recover and finish

If writing stalls or fails

1. Click Stop. Allow an already dispatched click to settle, then inspect the selected program/date in Office Puzzle.
2. Check the exact count or +/- pattern, not only the daily percentage. For partial interval data, verify Hours and unused blank rows.
3. Resolve any loading issue or incorrect selection. Use Retry when available if the saved task still represents the intended observed entry.
4. If the plan is wrong, remove the unfinished task and correct the data through the appropriate workflow before restarting.

Automatic batch recovery can keep waiting, rereading, and retrying the same task until it verifies or you press Stop. It should not advance to the next task while the current one is unverified. Do not assume every error automatically ends the run.

After a partial interval failure, the date strip suppresses stale planned values for the planning period and shows recorded values it can read. A previously displayed future percentage may disappear without any recorded Office Puzzle entry being deleted.

Choose the right clear action

Action	Effect
Trash icon on a task	Removes that task from the extension queue. Does not erase its Office Puzzle entry.
Clear under Tasks	Clears that task list in the extension. Does not clear recorded Office Puzzle data.
Top refresh icon	Relearns the client/page and clears extension planning inputs, related plans/hours, and current-context task lists. Office Puzzle data remains unchanged. Use after stopping the run.
More actions → Clear current date	Deletes the selected program's recorded entry for the selected date in Office Puzzle after confirmation. The assistant cannot undo this action.

Quick troubleshooting

Missing programs or wrong context: confirm the client and page, allow loading to finish, then scroll to the missing table. If needed, use the top refresh icon with the reset effect above in mind. After an extension update, refresh the Office Puzzle tab and reopen the panel.

Run is unavailable: check that there is at least one unfinished task for the selected date/page and that no write is already active. A task that was skipped because data exists will not make a new runnable queue.

Keyboard shortcuts

Enter in a weekly target field: Add + Next. Ctrl/Cmd + Enter: Add + Next. Alt + R: Run. Alt + P / Alt + N: previous / next program. Alt shortcuts are ignored while typing in an input or selecting a value; keep focus in the side panel.
